

## Faculti Summary

<https://staging.faculti.net/defining-patient-centered-medicine/>

This video video discusses the concept of patient-centered medicine, which emphasizes prioritizing the needs and concerns of patients over a disease-centered or doctor-centered approach. Originating in the 1960s, this approach critiques traditional medical practices that may treat patients as mere components of a disease management system. The speaker outlines the historical duality in medicine: the delivery of medical technologies and the care of individuals' subjective experiences of illness.

This video video critiques the current healthcare purchasing model in the U.S., which complicates consumer choice due to various filters like doctors and insurers, potentially obscuring costs. It also highlights that healthcare decisions can be driven by intense emotions, especially when the stakes are high, such as with a sick child.

While advocating for greater attention to patients' experiences, the speaker suggests that neither patients nor doctors can be viewed as the sole center of care. Instead, a more interconnected model is proposed, likening the relationship to a binary star system or the double helix structure of DNA, emphasizing the mutual dependence of patients and healthcare providers. This video video concludes by referencing the caduceus symbol, traditionally depicting two serpents, to illustrate the interwoven relationships in healthcare.
